File-based Systems

- File-based systems were an early attempt to computerize the manual filing system
- · File-based Systems defn
 - Collection of application programs that perform
 - services for the end users (e.g. reports).
 - Each program defines and manages its own data.

Limitations of File-based Appro

- · Separation and isolation of data
 - Each program maintains its own set of
 - Users of one program may be unaware of potentially useful data held by other programs.
- Duplication of data
 - Same data is held by different programs. Wasted space and potentially different values and/or different formats for the

Limitations of File-based Approa

- · Data dependence
 - File structure is defined in the program code.
- · Incompatible file formats
 - Programs are written in different languages, and so cannot easily access each others files.

Limitations of File-based Approa

- Fixed Queries/Proliferation of application programs
 - Programs are written to satisfy particular functions.
 - Any new requirement needs a new program.
- No control over access and manipulation of data beyond that imposed by application programs

Database various definitions

- · DB
 - Shared collection of logically related data (and a description of this data), designed to meet the information needs of an organization.
 - System catalog (metadata) provides description of data to enable programdata independence.
 - Logically related data comprises entities, attributes, and relationships of the organization's information.

Database various definition

- · DBMS:
 - A software system that enables users to define, create, and maintain the database and which provides controlled access to this database.

Database Management System (DBMS) Data entry and reports Sales application programs Data entry and reports Contracts Contracts application programs

Database architecture

 Three Level Architecture also known as ANSI-SPARC architecture, named after the committee that proposed it, the American National Standard Institute, Standards Planning And Requirements Committee.

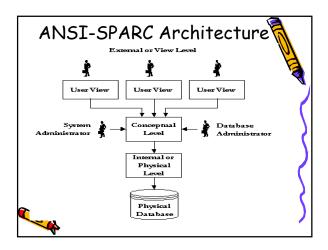

Objectives of Three-Level Architecture

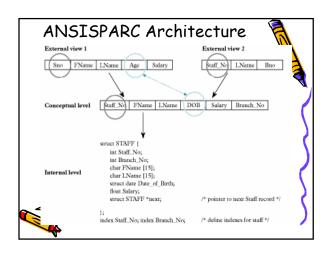

- All users should be able to access same data.
- A user's view is immune to changes made in other views.
- Users should not need to know physical database storage details.

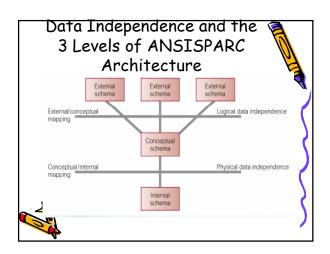

Objectives of Three-Level Architecture

- DBA should be able to change database storage structures without affecting the users' views.
- Internal structure of database should be unaffected by changes to physical aspects of storage.
- DBA should be able to change
 monceptual structure of database
 without affecting all

Data Independence

- · Logical Data Independence
 - Refers to immunity of external schemas to changes in conceptual schema.
 - Conceptual schema changes (e.g. addition/removal of entities).
 - Should not require changes to external schema or rewrites of application programs.

Data Independence

- · Physical Data Independence
 - Refers to immunity of conceptual schema to changes in the internal schema.
 - Internal schema changes (e.g. using different file organizations, storage structures/devices).
 - Should not require change to conceptual or external schemas.

Functions of a DBMS

- · Data Storage, Retrieval, and Update.
- · A User-Accessible Catalog.
- · Transaction Support.
- · Concurrency Control Services.
- · Recovery Services.

Functions of a DBMS

- · Authorization Services.
- Support for Data Communication.
- · Integrity Services.
- Services to Promote Data Independence.
- · Utility Services.

Advantages of DBMS

- · Control of data redundancy
- · Data consistency
- More information from the same amount of data.
- · Sharing of data
- · Improved data integrity
- · Improved security
- · Enforcement of standards

nomy of scale

Advantages of DBMS

- · Balanced conflicting requirements
- Improved data accessibility and responsiveness
- Increased productivity
- Improved maintenance through data independence
- Increased concurrency
- Improved backup and recovery services

Disadvantages of DBMS

- · Complexity
- Size
- · Cost of DBMS
- · Additional hardware costs
- · Cost of conversion
- · Performance
- · Higher impact of a failure

Adv and Disadv of DBMS

 For details of these advantages and disadvantages, read the attached copy on the website.

When a DBMS may be unnecessary

- If the database and applications are simple, well defined, and not expected to change
- If there are stringent real-time requirements that may not be met because of DBMS overhead.
- If access to data by multiple users is required.
