#### Definition

- A series of detailed instructions that control the operation of a computer system.
- Software exists as programs that are developed by computer programmers

# Categories of software

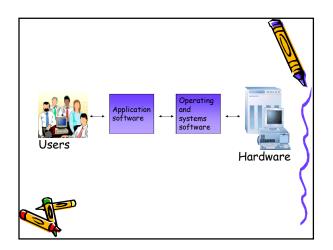

- Systems software:
  - This form of software manages and controls the operation of the computer system as it performs tasks on behalf of the user.
  - System software is computer software designed to operate the computer hardware and to provide and maintain a platform for running application software

# Systems software

- Is an interface or buffer between application software and hardware
- Controls the computer hardware and acts as an interface with applications programs

## Examples Of Systems Software

- The computer BIOS and device Firmware,
  - which provide basic functionality to operate and control the hardware connected to or built into the computer.

#### BIOS and device Firmware

- BIOS is a term that stands for basic input/output system.
- BIOS is really the link between hardware and software in a system.
- Most people know the term BIOS by another name device drivers, or just drivers.

#### BIOS and device Firmware

- The BIOS is boot firmware, designed to be the first code run by a PC when powered on.
- The initial function of the BIOS is to identify, test, and initialize system devices such as the video display card, hard disk, and floppy disk and other hardware

#### BIOS and device Firmware

- BIOS programs are stored on a chip and are built to work with various devices.
- They provide a small library of basic input/output functions that can be called to operate and control the peripherals such as the keyboard, text display functions and so forth.

#### BIOS and device Firmware

- The portion of the BIOS contained in ROM chips both on the motherboard and in some adapter cards is sometimes called firmware,
- which is a name given to software stored in chips rather than on disk.

#### Utility Software

- Utility software consists of programs which are designed to help with the maintenance of the computer and to ensure sure that it works correctly and efficiently.
  - e.g. disk defragmenter, anti-virus, firewall, backup, compression, disk cleaners, screensavers etc.

# Examples Of Systems Software

- The Operating System
  - prominent examples being Microsoft Windows, Mac OS X and Linux.
  - Linux is an open-source, popular, multitasking UNIX-type operating system
  - UNIX is a multitasking operating system developed in the early

#### The Operating System

- The operating system(OS) is the piece of software required by the computer to make sure that it works correctly and efficiently.
- It manages the computer and allows the user to communicate with the hardware.

## The Operating System

- Modern operating systems are typically stored on Hard disk and loaded into RAM when the computer is switched on.
- Storing the OS on disk means that it can be easily updated.
- Windows Vista and XP are updated on a daily basis.

# Operating System Function

- Perform common computer hardware functions (Input/Output)
- Provide a user interface
- Provide a degree of hardware independence
- Manage system memory
- Manage processing tasks
- Provide networking capability

Centrol access to system resources Manage files

### Input/Output Management

- Input/Output Management has to do with all the actual data transfers and issue the appropriate control signals to the peripheral devices.
- Input/Output Management has to send the correct signals to the Hard Disk to tell it to access and read the data and send it to RAM.

18

#### User Interface

- · User interface
  - A function of the operating system that allows individuals to access and command the computer
- · Command-based user interface
  - A particular user interface that requires text commands be given to the computer to perform basic activities
  - E.g., unix, DOS

#### User Interface

- Graphical user interface (GUI)
  - A user interface that uses pictures (icons) and menus displayed on the screen to send commands to the computer system
  - · E.g. Windows, MAC OS

# Operating System Functions

- · Hardware independence
  - Operating system (OS) provides hardware independence for application software
  - Application software interfaces with the operating system which interfaces with the hardware
  - When the hardware is changed, the operating system is changed so that the application software is not required to be changed

# Memory Management

- Memory management...
  - Controls how memory is accessed and maximizes available memory and storage

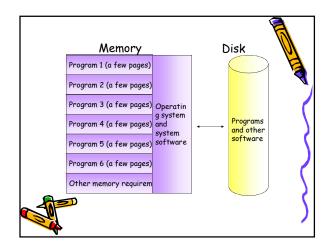

# Application Software What is the price of Flash (Flash K50) Memory Management OS Fetch Flash K50 from hard disk, track 1, sector 7

## Virtual Memory & Paging

- Virtual memory
  - Memory that allocates space in secondary storage to supplement the immediate, functional memory capacity of RAM
  - Paging
    - A function of virtual memory allowing the computer to store currently needed pages in RAM while the rest of the pages wait in secondary storage

## Manage processing tasks

- Multitasking
  - A processing activity that allows a user to run more than one application at the same time
- · Multithreading
  - A processing activity that is basically multitasking within a single application
- Time-sharing
- A processing activity that allows more than one person to use a computer system at the same time

## Operating System Functions

- Network capability
  - Aids in connecting the computer to a network
- · Access to system resources
  - Provides security for unauthorized access
- File management
  - Ensures that files in secondary storage are available when needed, and they are protected against unauthorized usage
